This sequence represents a primer which was used for relative quantitation of the distribution of the G protein coupled receptor, AdipoR1, mRNA in cells and tissues. The method of the invention for dermatological, therapeutic agents useful for treating cardiovascular, dermatological, gastroenterological, hematological, respiratory, neurological or urological diseases, cancer or inflammation in a mammal comprises contacting a test compound with an AdipoR1 polypeptide and detecting binding of the test compound to the AdipoR1 polypeptide and detecting binding of the test compound to the AdipoR1 polypeptide and further method is included for diagnosing any of the diseases cited above in a mammal comprising determining the amount of an AdipoR1 polypucleotide in a sample taken from the mammal and determining the amount of AdipoR1 polynucleotide in healthy and/or diseased mammals. Regulators of AdipoR1 activity are useful for regulating AdipoR1 activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

a subject. (MI) involves administering to the subject, a short interfering nucleic acid (siNA) molecule (I) that directs cleavage of a Fas RNA through RNA interference (RNAI) under conditions suitable to modulate the expression of Fas in the subject. Also described: (I) an expression vector comprising (I); (2) a kit comprising (I); (3) a human cell comprising (I); (4) a pharmaceutical composition comprising (I); and (5) a method of synthesizing (I). The present sequence represents a human Fas ligand (FasL) tumor necrosis factor receptor superfamily member 6 (TNFSFE) target and upper (sense) aiRNA oligonucleotide, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                      Treating spinal cord injury in subject, involves administering to subject, short interfering nucleic acid directing cleavage of Fas RNA through RNA interference under conditions suitable to modulate expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a method (M1) for treating spinal cord injury in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a method (MI) for treating spinal cord injury in a subject. (MI) involves administering to the subject, a short interfering nucleic acid (siNA) molecule (I) that directs cleavage of a Fas RNA through RNA interference (RNAi) under conditions suitable to modulate the expression of Fas in the subject. Also described: (1) an expression vector comprising (I); (2) a kit comprising (I); (3) a human cell comprising (I); (4) a pharmaceutical composition comprising (I); and (5) a method of synthesizing (I). The present sequence represents a human Fas ligand (FasL) tumor necrosis factor receptor superfamily member 6 (TNFSF6) lower (antisense) siRNA oligonucleotide, which is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Treating spinal cord injury in subject, involves administering to subject, short interfering nucleic acid directing cleavage of Fas RNA through RNA interference under conditions suitable to modulate expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0.6%; Score 16.4; DB 1; Length 19;

The invention relates to a novel chemically synthesized double stranded short interfering nucleic acid molecule that directs cleavage of a signal transducer and activator of transcription 3 (STMT3) RNA by RNA interference. The invention further includes a composition comprising the short interfering nucleic acid has cytostatic, antipporiatic, dermatological, antiinflammatory, and gastrointestinal-Gen activities. The short interfering nucleic acid or its composition is useful for treating, preventing, inhibiting, or reducing cancer, proliferative, and/or inflammatory diseases, disorders, or conditions in a subject or organism, such as psoriasis, eczema, dermatitis, Crohn's disease, and inflammatory bowel disease, and for any other disease, trait, or condition that is related to or will respond to the levels of STAT3 in a cell or tissue,
                                                                                                                                                                  gene silencing; cytostatic; antipsoriatic; dermatological; antinflammatory; gastrointestinal-Gen.; cancer; inflammation; psoriasis; eczema; dermatitis; Crohns disease; inflammatory bowel disease; siRNA; short interfering RNA; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel chemically synthesized double stranded short interfering nucleic acid molecule that directs cleavage of STAT3 RNA through RNA interference, useful for treating cancer and inflammatory diseases e.g. psoriasis in subject or organism.
                                                                                                                                               Signal-transducer and activator of transcription-3; RNA interference;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Example 3; SEQ ID NO 469; 266pp; English.

                                                                                                                           short interfering nucleic acid molecule that directs cleavage of a signal transducer and activator of transcription 3 (97AT3) RNA by RNA interference. The invention further includes a composition comprising the short interfering nucleic acid in a carrier or diluent. The short interfering nucleic acid has cytostatic, antipsoriatic, dermacological, antiinflammatory, and gastrointestinal-Gen activities. The short interfering nucleic acid or its composition is useful for treating, preventing, inhibiting, or reducing cancer, proliferative, and/or inflammatory diseases, disorders, or conditions in a subject or organism, such as psoriasis, eczema, dermatitis, Crohn's disease, and inflammatory bowel disease, and for any other disease, trait, or condition that is related to or will respond to the levels of STAT3 in a cell or tissue, alone or in combination with other treatments or therapies. This oligo sequence represents a STAT-3 siRNA strand of the invention.

The invention relates to chemically synthesized short interfering nucleic acids (siNAs) which downregulate expression of the vitamin D receptor (VDR) gene by RNA interference. The siNAs may or may not comprise ribonucleotides, can contain deoxyribonucleotides, can be chemically conditied and may be double or single stranded. They further comprise coligonucleotide and an antisense regions, or alternatively are assembled from a sense coligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA). The invention also relates to pharmaceutical compositions comprising an siNA targeted to a human covitamin D receptor manA (see RefSeq accession number NM 000376 (AEB65732)), especially the siRNAs shown in AEB65103-AEB65727. The invention further discloses expression vectors and host cells comprising an siNA of the invention. The siNAs are used to modulate expression of the vitamin D receptor gene in cells, tissue explants or organisms for the treatment of a variety of conditions. siNAs that downregulate vitamin C receptor expression may be used to prevent or reduce hair growth, and D receptor expression may be used to prevent or reduce hair growth, and con be used to targenia e used to prevent or reduce hair growth, and contain D receptor expression can be used in the treatment or prevention of alphoeia (e.g., androgenic alopecia), arricina or other disorder associated with a deficiency of vitamin D receptor expression and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide columns) the antisense strand of a single human vitamin D receptor transcript variant l-targeted double-stranded columns.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                         Novel chemically synthesized double-stranded short interfering nucleic
                                                                                                                                                                                                                                                                                                                                                acid molecule directing cleavage of vitamin D receptor RNA through RNA interference, useful for treating such as alopecia and atrichia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0.6%; Score 16.4; DB 1; Length 19; 94.4%; Pred. RESULT 1410

ઠ 유 AEE65297

The invention relates to chemically synthesized short interfering nucleic acids (sinAs) which downregulate expression of the vitamin D receptor (VDR) gene by RNA interference. The sinAs may or may not comprise ribonucleotides, can contain deoxyribonucleotides, can be chemically sense and antisense regions, or alternatively are assembled from a sense coligonucleotide. Specifically, the sinAs include short interfering RNA (siRNA). The invention also relates to pharmaceutical compositions comprising an sinA targeted to a human comprasing an sinAs include short interfering RNA (siRNA). The invention also relates to pharmaceutical compositions comprising an sinA targeted to a human comprasing the specially the siRNAs shown in AEBES103-AEE6572. The caspecially the siRNAs shown in AEBES103-AEE6572. The caspecially the siRNAs shown in AEBES103-AEE6572. The caspecially the siRNAs shown in AEBES103-AEE6572. The caspecial of an siRNAs shown in AEBES103-AEE6572. The caspecial of an include expression of the treatment of a variety of conditions. SiNAs that downregulate vitamin D receptor gene in cells, tissue explantes or organisms of the treatment of a variety of conditions. SiNAs that downregulate vitamin D receptor anaphase in hair folicites for hair removal (depilation). SiNAs that act to upregulate vitamin D receptor expression can be used to target anaphase in hair folicites for hair removal (depilation). SiNAs that act to upregulate vitamin D receptor expression con the treatment or prevention con vitamin D receptor expression of an inhibitor of such a slopecia (e.g., androgenic alopecia), articitia or other disorder associated with a deficiency of vitamin D receptor expression. The siNAs Novel chemically synthesized double-stranded short interfering nucleic acid molecule directing cleavage of vitamin D receptor RNA through RNA interference, useful for treating such as alopecia and atrichia. hair disease; depilatory; alopecia; atrichia; endocrine-gen.; Claim 33; SEQ ID NO 195; 238pp; English. may also be used in drug screening, diagnostics, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the sense strand of a human vitamin D receptor transcript variant 1-targeted double-stranded siRNA, which is identical to the human vitamin D receptor transcript variant 1 target sequence.
                                                                                                                                                        Gaps

The invention relates to chemically synthesized short interfering nucleic acids (siNAs) which downregulate stromal cell-derived factor-1 (SDF-1, chemokine CXC motif ligand 12, CXCL12) gene expression by RNA interference. The siNAs are characterized in that one or more nucleotides is chemically modified to reduce the immunostimulatory properties of each sinA to a level below that of a corresponding unmodified siNA.

CC siNA to a level below that of a corresponding unmodified siNA.

CC sinAt to a level below that of a corresponding unmodified siNA.

CC ditther comprise sense and antisense regions, or alternatively are contain deoxyribonucleotides, and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are contain a sense oligonucleotide and an antisense oligonucleotide.

CC further comprise sense and antisense regions, or alternatively are specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA), the siNAs include short interfering RNA (siRNA). The siNAs of the invention are used to condulate expression of the SiP-1 gene in cells, tissue explants or corganisms (e.g., by ex vivo gene therapy), or in grafts and transplants correction of cancer and other proliferative conditions, respiratory diseases, cardiovascular diseases and coular diseases, and are especially cuseful for the treatment of fabetic retinopathy (proliferative cretinoplasty). The siNAs may also be used in drug screening, therapeutic target identification and validation, genetic engineering, parameted conditions, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the construction and validation in degeneral conditions, the sinAs may also be used in drug screening, settled to the sinAs may also be used in drug screening.

CC stanscript variant 1 (CXCL12b), which is identical to the human SDF-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                   molecule directing cleavage of stromal cell derived factor-1 RNA, useful for treating cancer and ocular, respiratory and cardiovascular diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  RNA interference, gene silencing, short interfering RNA, siRNA, cancer, neoplasm, hyperproliferation, cytostatic, respiratory disease, respiratory-gen., cardiovascular disease, cordiar disease, ophthalmological, diabetic retinopathy, antidiabetic, stromal cell-derived factor-1, SDF-1, chemokine CXC motif ligand 12;

AAV12302; 18 RESULT 1413 AAV12302 ò 셤 The invention relates to chemically synthesized short interfering nucleic acids (siNAs) which downregulate stromal cell-derived factor-1 (SDF-1, CCCL12) gene expression by RNA chemically modified to reduce the immunostimulatory broperties of each sink to a level below that of a corresponding unmodified siNAs.

Cofficially, the siNAs may or may not comprise ribonucleotides, can contain deoxyribonucleotides, and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA). The stranded that micro-RNA (miRNA) and short hairpin RNA (siRNA). The contained sor relates to pharmaceutical compositions comprising an siNA trargeted to an SDF-1 mRNA. The siNAs of the invention are used to condulate expression of the SDF-1 gene in cells, tissue explants or contained sort the transplants of corganisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of avriety of conditions. They may be used in the treatment of ancer and other proliferative conditions, respiratory diseases, and are especially cusful for the treatment of diabetic retinopathy (proliferative cusful for the treatment of diabetic retinopathy (proliferative cusful for the treatment of diabetic retinopathy (proliferative cusing, pharmacogenomics, studying gene function, and gene mapping (e.g., of antisense strand of a double-stranded siRNA targeted to human SDF-1 contined and siRNA targeted to human SDF-1 Chemically synthesized double-stranded short interfering nucleic acid molecule directing cleavage of stromal cell derived factor-1 RNA, useful for treating cancer and ocular, respiratory and cardiovascular diseases. The present sequence represents a 3'-untranslated region (3'UTR) fragment of ribonucleotide reductase R1. The present invention describes: (1) cof ribonucleotides (ON) comprising at least 7 consecutive nucleotides (IN) comprising at least 7 consecutive nucleotides (IN) conjudence on UTR of a housekeeping gene; (2) antisense ON CC (AON) complementary to ON; (3) ribozymes (Rb) complementary or homologues (AON) complementary to ON; (3) ribozymes (Rb) complementary or homologues (CC (5) an antibody (Ab) that binds to ON, OAN and Rb; (6) ant probe in P CC (5) an antibody (Ab) that binds to ON, OAN and Rb; (6) ant probe in P CC (5) an antibody (Ab) that binds to ON, AON, AON, Rb and Ab are used to modulate (especially inhibit) growth of tumour cells (especially neoplastic cells) and to reduce their capacity for metastasis. The above may also be used to treat benign proliferative disorders e.g. human immunodeficiency virus, cangiogenesis and viral infections, e.g. human immunodeficiency virus, hepatitis or herpes. ON may further be used: (1) to identify modulators of tumour growth/metastasis; (ii) to identify compounds (especially compounds (especially for monitoring properses of cancer therapy. SON inhibit tumour gentification and quantification compounds of cumorification cells, particularly where these are ö ö New oligo-nucleotide(s) complementary to untranslated regions of housekeeping genes - are useful in, e.g. identifying modulators of tumour growth/metastasis and inhibiting growth of neoplastic cells.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                      Human; fucosyltransferase; FUT3; FUT6; cancer; antisense oligonucleotide;
                                                                                                                                                                                                                                                                                                                                                              The present invention provides antisense oligonucleotides to the human fucosyltransferase coding sequences, particularly FUT3 and FUT6. These antisense sequences can be used in the treatment of cancer, especially colon, pancreatic, ovarian, gastric, breast, lung, hepatocellular, prostate, bladder, renal cell and uterine cancers. In addition, they can also be used in the treatment of animals such as dogs, cats and horses
                                                                                                                                                                                                                                                                                                                  Novel antisense human fucosyltransferase sequences useful for treating cancer including breast, lung, gastric, renal and uterine cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Insulin-like growth factor binding protein-5; IGFBP-5; human;

This sequence represents an antisense oligonucleotide targeted against human insulin-like growth factor binding protein-5 (IGFBP-5). The invention relates to a composition for treatment of hormone-regulated cancer, comprising an antisense oligonucleotide (such as this sequence) which inhibits expression of IGFBP-5 by hormone-regulated tumour cells. The compositions is useful for delaying progression of hormone-regulated tumour cells such as prostatic cancer cells or breast cancer cells, to an antrogen-independent state, by treating hormone sensitive tumour cells androgen-independent state, by treating hormone sensitive tumour cells cumour cells. The composition can also be used for treating a hormone-responsive cumour cells in individual and administering the composition to the individual after initiation of hormone-withdrawal to induce apoptotic cell death of hormone-responsive tumour cells, and therefore delaying the progression of hormone-responsive cancer cells to a hormone-independent composition to individual. It can also be used for inhibiting or delaying metastatic boney progression of an IGF-1 sensitive tumour in a mammal, by administering the composition to inhibit the expression of IGFBP-5 by the composition to inhibit the expression of delaying content of the composition to inhibit the expression of delaying content of the content of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Composition for treating hormone-regulated cancer, e.g. breast and prostatic tumors, comprising an antisense oligonucleotide that inhibits expression of insulin like growth factor binding protein-5 by hormone-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                          ð
                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                    The invention relates to a novel polynucleotide isolated and purified from a human gene having any one of 935 fully defined sequences as given in specification, or a sequence having a base substitution. The invention further relates to: an oligonucleotide containing single nucleotide polymorphisms; a PCR primer set chosen from the combination of two DNA fragments from any one of 1220 fully defined sequences as given in specification; a labelling probe containing the SNP containing oligo, and a microarray equipped with the SNP containing the single nucleotide gene of the invention is useful for detecting the single nucleotide
                                                                                            Novel polynucleotide useful for detecting single nucleotide polymorphisms
                                                                                                                                                                                                                                                              polymorphisms in human gene. The isolated human gene is also useful for diagnosis of disease and determination of side effect to a medical agent. The isolated human gene is also effective in detecting single nucleotide polymorphisms in a human gene. This polymucleotide sequence represents one of the PCR primers used in the single nucleotide polymorphism detection method of the invention.

```
The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the intiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' end advinctions of genes encoding prepride associated with lung and/or junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention comparation and a second active agent comprising an antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition may have a composition at sepiratory, lung or mallignamt disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an entiinflammatory steroid in a subject, for reducing or depleting levels of contining sensitivity to adenosine, reducing or depleting levels of continion, continuation, lung allergies, or a respiratory disease or condition, lung allergies, or a respiratory disease or condition.

Conting inflammation, lung allergies, or a respiratory disease or condition, and the printed contined in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating comprising oligonucleotides, effective for alleviating construction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, curfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery of device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or composition comprises oligo and is administered to reduce the production or reating a respiratory, lung or mailgnant disease. The administered cor availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and asease or condition such as pulmonary vasoconstriction, inflammation, allergies and/or surfactant hypoproduction are associated with a mannarion and asease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonuclectides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it
                                                                                                                                                                                                     ဌ
                                                                                                            Pharmaceutical composition for treating asthma, has antisense oligonuclectide containing less percentage of adenosine, targeted trucleic acids associated with lung airway or lung dysfunction, and

New antisense compound targeted to a nucleic acid molecule encoding mammalian glucocorticoid receptor, useful for treating diabetes, obesity, cardiovascular disorder, hyperlipidemia or Cushing's syndrome.

Claim 4; SEQ ID NO 3214; 985pp; English.

to nucleic acids encoding a mammalian glucocorticoid receptor. The antiense oligonucleotides of the invention are useful for preventing or delaying infection, inflammation or tumour formation. The antisense oligonucleotides are also useful for treating diabetes, obesity, cardiovascular disorders, hyperlipidaemia or Cushing's syndrome. The present DNA sequence represents an antisense oligonucleotide that targets the human glucocorticoid receptor gene. NOTE: The present sequence contains 2'-methoxyethyl (2'-MOE) wings and a phosphorothioate backbone. The invention comprises an antisense oligonucleotides that are

e.g., Novel single or multiple target oligonucleotide anti-sense to e.g. initiation codons and introns of respiratory disease-relevant genes CCR1, RANTES, MCP4, useful for prophylaxis or treating respiratory

```
The present invention relates to an oligonuclectide anti-sense to e.g., initiation codon, coding region with 2-10 nuclectides of 5'-end and 3'-end of nucleic acid trarget comprising gene(s) chosen from e.g. interleukin (IL)-4 receptor, IL-5 receptor or salts of the cidentellar optionally surfactant operatively linked to the oligonuclectide and optionally surfactant operatively linked to the coligonuclectide. The method is useful for preventing or treating a respiratory or lung disease, which involves administering to the airways of subject an effective amount of an inhibitor. The oligonuclectide is useful for production of a medicament for the prevention and/or treatment of a respiratory or lung disease. The respiratory or lung disease is chosen from airway inflammation, allergy(ses), asthma, impeded chosen from airway inflammation, costic fibrosis (CF), chronic obstructive pulmonary diseases (COPD), allergic rhinitis (AR), acute respiratory distress syndrome (ARDS), pulmonary hypertension, lung inflammation, bronchitis, airway obstruction. The present sequence represents an oligonucleotide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New antisense compound targeted to a nucleic acid molecule encoding Nav1.3, useful for useful for treating a disease or condition associated with Nav1.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Navl.3; Analgesic; Nootropic; Neuroprotective; post-herpetic neuralgia; diabetic neuropathy; arthritic pain; migraine headache; infantile epilepsy; ataxia; ss.

associated with Nav1.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain, diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain, pain from burns, migraine headache, cluster headache, mild-to-moderate headache; seizure disorder such as childhood seizure disorder, including but not limited to neonatal or infantile epilepsy; or ataxia. The present sequence represents a chimeric phosphororhioate oligonucleotide with 2'MOE wings and a deoxy gap. Used during the antisense inhibition of human Nav1.3 expression, the oligonucleotides are designed to target different regions of the human Nav1.3 RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel single or multiple target oligonucleotide anti-sense to e.g. initiation codon, intron of respiratory disease-relevant gene e.g. CCR1, RANTES, MCP4, useful for prophylaxis or treating respiratory disease e.g.

The invention relates to oligonucleotides anti-sense to an initiation codon, coding region, 5' or 3' intron-exon junction, intron or region with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target chosen from a gene encoding interleukin (IL) -4 receptor, interleukin (IL) -5 receptor, CCR1, CCR3, Ectaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C or PDE4 D. The invention also relates to a method of screening a candidate compound that binds to one or more nucleic acid target(s) or expressed product(s), for the prevention and/or treatment of a respiratory or lung disease. The prevention and/or treatment of a respiratory or lung disease. The gene or mRNA encoding interleukin-4 receptor, interleukin-5 receptor, CCR1, CCR3, Ectaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C, or PDE4 D. The oligonuclectides are useful for reating a respiratory or lung disease. The respiratory or lung disease is associated with hyper-responsiveness to receptor of a medical control of a denosine and/or levels of denosine A receptor(8), and/or asthma and/or lung allergies associated with inflammation or an inflammatory disease. The respiratory or lung disease is chosen from airway inflammation, allergy, asthma, impeded respiration, cystic fibrosis (CF), chronic obstructive pulmonary disease (COPD), allergic rhinitis, acute respiratory distress syndrome, pulmonary hypertension, lung inflammation, bronchitis, airway obstruction or bronchoconstriction. This sequence represents an oligonucleotide of the

New antisense oligonucleotides encoding mitoNEET, useful for modulating mitoNEET expression or for treating diseases associated with mitoNEET, e.g. diabetes, immunological disorders or cardiovascular disorders.

```
The invention comprises antisense oligonucleotides that are targeted to membranes, which bind insulin sensitising, antidiabetic thiazolodinediones (referred to as: mitoNEET). The antisense oligonucleotides of the invention are useful for modulating mitoNEET expression and for treating diseases or conditions associated with mitoNEET, such as: diabetes, immunological disorders, cardiovascular disorders including hypertension, neurological disorders, and sischaemia/reperfusion injuries. The present DNA sequence represents a mitoNEET-specific antisense oligonucleotide of the invention. NOTE: The phosphorothioate backbone.

Peptides having at least two new nucleotides - useful as primers in RT-

Example 1; Page 12; 19pp; Japanese.

to sequences of at least two nucleotides of formula: (X)m5'-(alpha)n-beta-N3'; or (X)m5'-(gamma)k-delta-N3'; where X = a labelled compound and/or a nucleotide with voluntary sequence; m = 0 or 1; alpha = thymine; n = natural number indicating the repetition of alpha; beta, delta = V or N; V = adenine, guanine or cytosine; N = adenine, guanine, cytosine or thymine; gamma = thymine; k = natural number of 3 or over indicating the repetition of gamma; in which thymine expressed by gamma is composed of 1/3 or less of adenine, guanine and/or cytosine. The new nucleotides are useful as primers for RT-PCR and determination of base sequences. The new sequences allow for reproductive and highly efficient analysis of gene This sequence represents a primer of the invention. The invention relates sednences

The invention relates to sequences of at least two nucleotides of formula: (X)m5'-(alpha)n-beta-N3'; or (X)m5'-(agmma) K-delta-N3'; where X = a labelled compound and/or a nucleotide with voluntary sequence; m = 0 or 1; alpha = thywine; n = netural number indicating the repetition of alpha; beta, delta = V or N; V = adenine, guanine or cytosine; N = adenine, guanine or cytosine; N = adenine, guanine or thymine; k = netural number of 3 or over indicating the repetition of gamma, in which thymine expressed by gamma is composed of 1;3 or less of adenine, guanine and/or cytosine. The new nucleotides are useful as primers for RT-PCR and determination of base sequences. The new sequences allow for reproductive and highly efficient analysis of gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Peptides having at least two new nucleotides - useful as primers in RT-

The sequence is that of the 3' end of a sequence encoding a secreted protein from a human fetal kidney clone AK296. Such a sequence is predicted to have biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, cytokine and cell proliferation/differentiation activity, immacopolesis regulating (e.g. as proliferation/differentiation activity, haemacopolesis regulating activity, tissue growth activity, activity, haemacopolesis regulating activity, chemotactic/chemokinetic activity, haemacopolesis and thrombolytic activity, inceptor/ligand activity, anti-inflammatory activity, cadherin/tumour invasion suppressor activity, and tumour inhibition activity. It is also stated to be useful for gene therapy
                                                                                                                                                                                                                                                                  New polynucleotides encoding secreted human proteins - are derived from foetal kidney or adult retina cDNA libraries, used as, e.g. potential
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  DNA chip; primer; nucleoside derivative; photolabile protecting group; photolithographic nucleic acid chip; ss.

This invention describes nucleoside derivatives (I) with photolabile protecting groups. (I) are used to synthesize oligonucleotides using the photolithographic nucleic acid chip method, particularly where these are intended for performing enzymatic reactions initiated from a free 3. hydroxy (especially solid-phase polymerase reactions or ligase reactions, but also reverse transcription, cDNA synthesis etc.), also for hybridization testing, sequencing and in DNA computing. (I) are produced with high selectivity by reaction with a mild acylating agent that has high specificity for the 3. position, without significant side-reactions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /note= "OTHER = F1(CH2)6-PO-thymine, where F1 is flavine and PO is a phosphate group"

The present sequence is that of an oligonucleotide (ODN)-minor groove binder (MGF) complex. MGBs bind in a non-intercalating manner to the minor groove of non-single-stranded DNA, RNA or their hybrids. ODN-MGB-LF conjugates of the invention also comprise a latent fluorophore (LF), which binds similarly to the MGB but in an intercalating manner, or lies in the minor groove, or is oriented in some other way to the DNA molecule by MGB, such that it becomes fluorescent (or its fluorescent properties change detectably). The conjugates are used as hybridisation probes and
                                                                The present invention relates to an analytical support, to which a number of Oligonucleotides are labelled with a fluorescent compound, the fluorescence of which varies when the oligonucleotide hybridises to its complement. The analytical support is useful in hybridisation testing for identification of specific nucleic acids, such as genomic sequencing, detecting mutations or pharmaceutical development. The present oligonucleotide was used to illustrate the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Conjugate of oligonucleotide, minor groove binder and latent fluorophore, useful for detecting specific nucleic acids, e.g. for single-nucleotide mismatch discrimination.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ODN-MGB-LF; oligonucleotide; minor groove binder; latent fluorophore; hybridisation; detection; fluorescence; probe; ss.

```
The present sequence is that of the oligonucleotide (ODN) component of an ODN-MGB (minor groove binder)—LF (latent fluorophore) conjugate of the invention. MGBB bind in a non-intercalating manner to the minor groove of invention. MGBB bind in a non-intercalating manner to the minor groove of the on-single-stranded DNA, RNA or their hybrids, while a LF binds similarly but in an intercalating manner, or lies in the minor groove, or is confected in some other way to the DNA molecule by MGB, such that it conjugates are used as hybridisation probes and amplification primers or for fluorescent detection of specifically hybridising sequences, for analysis or diagnosis, especially (real-time) PCR, for single-nucleotide mismatch discrimination, target or signal amplification, array-based assays and sequencing, including detection of double-stranded DNA by triplex formation. Many different targets can be detected a single reaction-triggered fluorescence. Upon hybridisation to the complementary target sequence there was an increase in fluorescence complementary target sequence there was an increase in fluorescence complementary target sequence there was an increase in fluorescence between the ODN-MGB-LF conjugate and its target sequence to the fluorescence emitted by unhybridised (i.e. single-stranded) ODN-MGB-LF, of 8.3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Conjugate of oligonucleotide, minor groove binder and latent fluorophore, useful for detecting specific nucleic acids, e.g. for single-nucleotide mismatch discrimination.
amplification primers for fluorescent detection of specifically hybridising sequences, for analysis or diagnosis, especially (real-time) PCK, for single-nucleotide mismatch discrimination, target or signal amplification, array-based assays and sequencing, including detection of double-stranded DNA by triplex formation

```
moieties optionally extended by a polymerase. The branched chain compounds of the invention are used in nucleic acid synthesis reaction, primer extension reaction, reverse transcription reaction of RNA into DNA, nucleic acid hybridization experiment (for identifying sequence of a nucleic acid), and nucleic acid amplification experiment (for analysing the expression pattern of genes). The compounds are also used in solid-phase enzymatic reactions. The present sequence was used in the course of the invention to produce branched chain compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

This invention relates to oligonuclectide analogues comprising a protein nucleic acid molecule (PNA) monomer. They are used in the detection and separation of nucleic acid molecules and as probes, primers, linkers, adapters and antisense agents on solid supports. Modifications enhance their use as capture and detection probes e.g. by the incorporation of biotin, digoxigenen, radioisotopes, fluorescent labels such as Liuorescein and reporter molecules such as alkaline phosphatase. They are also used for enhancing or inhibiting the activity of an enzyme or cellular activity. The compounds are stable to nucleases and proteases, have high affinity, binding specificity and solubility. The polyamide backbone of FNAs is resistant to both nucleases and proteases. PNAs bind nucleic acid molecules with greater affinity than DNA or RNA concentration. The compounds are relatively simple to synthesize and are used in a wide variety of applications. This sequence represents a DNA coligoner which is used to represent the thermal stability of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     separation and purification dimers and oligomers.
                                                                                                                                                                                                 Nucleotide sequence of oligomer # 1 used to test thermal stability.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0.6%; Score 16; DB 1; Length 16;

The invention relates to an acyclic linker-containing oligonucleotide comprising at least one modified deoxyribonucleotide. Oligonucleotides of the invention are useful for preventing or decreasing translation, reverse transcription and/or replication of a target RNA in a system. They are useful for selectively preventing gene expression in a sequencespecific manner, for hybridising to complementary RNA such as cellular mRNA or viral RNA, to hybridise to complementary RNA such as cellular mRNA or viral RNA, to hybridise to and induce cleavage of complementary RNA. They are also useful therapeutically in formulations or medicaments to prevent or treat a disease characterised by the expression of a particular target RNA. The invention is used in gene therapy. The present sequence is an antisense oligo used to elicit human RNase (ribonuclease) H degradation of target RNA. This sequence is used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

The invention relates to a novel assay for detecting a polynucleotide in a sample, which comprises: contacting a sample suspected of containing a carget polynucleotide with a predetermined single-estranded sensor polynucleotide complementary to the target polynucleotide, in a solution comprising an agent that is a nonaqueous solvent that allows the sensor comprising an agent that is a nonaqueous solvent that allows the sensor comprising an agent that is a nonaqueous solvent that allows the sensor polynucleotide, and determining fluorescence emission. The assay is useful for detecting a single or double-stranded target cassay is useful for detecting a single or double-stranded target comparison and polynucleotide, such as, DNA or RNA in a sample. The assay finds use in a polynucleotide, such as, DNA or RNA in a sample. The assay finds use in a corresic testing to identify the species or individual which was the source of a forensic specimen, in anthropological setting, paternity for eneming testing for compatibility between prospective tissue or blood conors and patients and in screening for hereditary disorders. The method is also useful to study alterations of gene expression in response to a stimulus, disease, drug or medication, and other applications include human haplotype diversity. The method is useful for detecting polynucleotide sequences from contaminants or pathogens including bacteria, yeast, and viruses to detect single nucleotide sequences from contaminants or pathogens including bacterial, yeast, and viruses to detect single nucleotide sequences from contaminants or pathogens of allelee. The method is useful for detection of mutations and to detect and alleles or the method is useful for detection of detections and to detect allowed and allelees of 
                                                                                                                                                                                                            Detection; single-stranded sensor; detectable fluorescence emission; forensic testing; paternity testing; tissue typing; hereditary disorder; human population genetics; human evolutionary history; cystic fibrosis; human haplotype diversity; Tay-Sachs; sickle-cell anaemia; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             polynucleotide sequence represents an oligonucleotide sequence used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             disorders including cystic fibrosis, Tay-Sachs, and sickle-cell anaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Detecting polynucleotides, for pharmacogenetic testing, comprises contacting a target polynucleotide with a complementary single-stranded sensor polynucleotide and an agent that allows the sensor to fluoresce
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    0.6%; Score 16; DB 1; Length 16; 100.0%; Pred. ```
The invention relates to a novel method of inhibiting the expression of one or more genes or RNA transcripts by administering at least one oligonucleotide analogue that includes at least one hydroxyproline nucleic acid (HypNA) monomer to a cell or organism or their extracts. Throlling gene expression, respiration, secretion, signalling, ion-including gene expression, respiration, secretion, signalling, ion-expression. Furthermore, they may be utilised to determine the effects of particular genes, as antisense or homologous recombination constructs eg. for creating animal models of disease and finally, for increasing the activity of some enzymes, such as polymerases. The current sequence is that of the DNA hybridisation oligomer SEQ ID 9 of the invention. This

                                                                                                                                                                                                                                                                                                                       This invention relates to a novel method for nucleic acid analysis.

Specifically, it refers to a kit for performing nucleic acid detection using a chip to identify a target polynuclectide sequence. The present invention provides a chip (microarray) for nucleic-acid detection that significantly reduces non-specific binding produced between a test substance nucleic acid and a DNA probe. As such, this method can be used to detect the existence of a target sequence in a sample and for the analysis of polymorphisms, expression analyses, and presence or absence of a gene expression and SNPs, micro satellite sequences. Furthermore, of a gene expression and SNPs, micro satellite sequences. Furthermore, for diagnosis of disease by analyzing disease-related genes, estimation of incidence risk rate, detection of infected existence, analysis of virus type etc. This DNA microarray also has applications for various. Colinical objectives and for the inspection of food stuffs, quarantine, pharmaceutical, forensic medicine, agriculture, live stock forming, fishing and forestry. This oligonucleotide sequence is a used in the development of the DNA microarray of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                  complementary to target sequence and sequence existing in nature at low probability and probe for trapping which is complementary to medium

                                                                                                                                                                                                                                                                                                                                                                                                                                                   eliminating single-stranded oligonucleotide from the transcription sample. The method involves synthesizing single-stranded cDNA by incubating the sample RNA with reverse transcriptase and an oligonucleotide primer that primes synthesis in a direction toward 5' end of the RNA; converting the single-stranded cDNA into double-stranded cDNA to form a transcription sample containing a cDNA template; eliminating single-stranded oligonucleotide from the transcription sample; and transcribing the cDNA template into RNA using an RNA polymerase. The method is useful for improving RNA polymerase based RNA transcription template derived production of RNA in the transcriptis the undesired nontemplate derived production of RNA in the transcription reaction. Sequences AD134483-AD134489 represent oligonucleotides used in a 77 RNA
                                                                                                                                                                                                             Amplifying for RNA in a sample, useful for improving RNA polymerase based RNA transcription from a polynucleotide template, comprises eliminating single-stranded oligonucleotide from the transcription sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Oligo, SEQ ID NO: 1, to make full-length coding sequence cDNA libraries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Making full-length coding sequence cDNA libraries for research purposes comprises binding a tag molecule (e.g. biotin or avidin) to a diol structure present in the 5' cap site of an mRNA forming an RNA-DNA hybrid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The present invention relates to a method for making cDNA libraries wherein the CDNA inserts comprise the full-length of the mcding sequences but but having lengths less than the full-length of the mRNA. The method of the invention comprises binding a tag molecule to a diol structure present in the 5' Cap sites of mRNAs, forming RNA-DNA hybrids in to synthesize the first cDNA strand, spearating RNA-DNA hybrids carrying a DNA corresponding to full-length of mRNAs from RNA-DNA hybrids formed above by using a function of the tag molecule and strand, aperating the second cDNA strand by self-priming the first cDNA strand by contain the full-length of the mRNAs but do contain the full-length of the coding sequences of the mRNAs. The invention is useful for making or constructing full-length coding sequence cDNA libraries which may be utilized in researches in the fields of medical science and biology. The present sequence is an in the fields of medical science and biology. The present sequences cDNA

Corn tyrosin protein phosphatase gene and its coding protein and use. Example 2; Page 6; 13pp; Chinese. The invention describes a ZmRSFTP1 gene, its coding protein and use. The EmRSFTP1 gene is one of the following ribonucleotide sequence: 1) SEQ ID No:1 in sequential table; 2) ribonucleotide sequence of coded SEQ ID No:2 protein sequence; 3) DNA sequence having 90% homology with DNA sequence refined by SEQ ID No:1 in sequentialtable. It can be used to breed drought-resistant plant and corn. This sequence represents an oligonucleotide associated with the isolation of ZmRSPTP1.

Determining a target nucleic sequence comprises cleaving transcript of sequence in a sequence-specific manner, determining molecular weight of fragments, performing fragment identity mapping and comparing the observed mass.

Example 1; SEQ ID NO 27; 92pp; English.

The invention relates to determining a target sequence of a template

nucleic acid. The method involves: creating a transcript of an isolated

cuplete nucleic acid using polymerase enzyme and nucleosides selected

corresponding to the sequence specific reactions resulting in complete cleavage of

primers; performing a cleavage reaction resulting in complete cleavage of

the transcript in a sequence specific manner into fragments using cutters

selected from the group consisting of enzymmaic cutters, chemical

cutters, and their combination, analyzing the cleavage reaction products

cutters and their combination; analyzing the cleavage reaction products

cutters and the molecular weights of the fragments performing fragment

identity mapping using nucleotide masses and cleavage reactions,

che cutters to calculate the molecular weights and sequences of all

consible fragments that result from the second step cleavage reactions,

and comparing the masses observed in the third step with the fragment

cleantity mapping, where the comparison results in determination of all

cleantity mapping, where the comparison results in determination of all

che target sequences present in the sample. In determination of all

sequence of a template nucleic acid, the steps are performed at least two

times with different cutters, thus allowing production of overlapping

fragments, and compiling the overlapping fragments to produce at least

The method involves: creating a transcript of an isolated template nucleic acid using polymerase enryme and nucleosides selected for sequence specific reactivity and molecular weight and oligonucleotide primers; performing a cleavage reaction resulting in complete cleavage of
one larger subsequence. The larger subsequence is the complete sequence of the template. The primers are sequence specific and have a random sequence. The molecular weight is determined using mass spectroscopy which is matrix-assisted laser desorption/ionization time-of-flight spectroscopy. The method allows de novo detection of sequences in a target nucleic acid without requiring any prior sequence information. Also provided is a method for determining the number of genes in a nucleic acid sample. Sequences AED63145-AED63168 represent modified fragments produced during fragment identity mappings for 16/15[inv(alpha.alpha)]:4 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Determining a target nucleic sequence comprises cleaving transcript of sequence in a sequence-specific manner, determining molecular weight of fragments, performing fragment identity mapping and comparing the observed mass.

the transcript in a sequence-specific manner into fragments using cutters selected from the group consisting of enzymatic cutters, chemical cutters, and their combination; analyzing the clasvage reaction products to determine the molecular weights of the fragments; performing fragment identity mapping using nucleotide masses and cleavage specificities of the cutters to calculate the molecular weights and sequences of all possible fragments that result from the second step cleavage reactions; and comparing the masses observed in the third step with the fragment of and comparing the masses observed in the third step with the fragment of the target sequences present in the sample. In determining a target sequence of a template nucleic acid, the steps are performed at least two times with different cutters, thus allowing production of overlapping fragments and compiling the overlapping fragments to produce at least conclusions and surpayers subsequence is the complete sequence of the template. The primers are sequence specific and have a random sequence. The melecular weight is determined using mass spectroscopy which is matrix-assisted laser desorption/ionization time-of-flight contraction of sequences in a contract of carry in the nucleic acid without requiring any prior sequence in a new product in a contract in the number of cannes in a new part of cannes in a new product of cannes in a new part of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A patient (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples
                        The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A patient (preferably human) having a condition associated with the level of the fims-like tyrosine kinase 1 (flt-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1; KDR; hammerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor;

This protein and antibodies generated from the protein can be used for treatment and diagnosis of malignant tumours, parasitic infections, allergic inflammation, eosinophilic pneumonia, rapid onset eosinophilia, and autoimmune diseases. DNA can be used for diagnosis, and the antisense DNA in gene therapy of these disorders. The protein can be used for screening of potential agonists or antagonists of its activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DNA and encoded protein which activates eosinophil cells - for treatment of cancer, parasite infection, autoimmune disease and allergic inflammation.

                                                                                                                                                                                                                                                                                                              This sequence represents a primer of the invention. The invention relates to sequences of at least two nucleotides of formula: (X)m5'-(alpha)n-beta and; or (X)m5'-(almma)k-delta-N3'; where X = a labelled compound and/or nucleotide with voluntary sequence; m = 0 or 1; alpha = thymine; n = natural number indicating the repetition of alpha; beta, delta = V or N; V = adenine, guanine or cytosine; N = adenine, guanine or thymine; and = thymine; a natural number of 3 or over indicating the repetition of gamma, in which thymine expressed by gamma is composed of 1/3 or less of adenine, guanine and/or cytosine. The new nucleotides are useful as primers for RT-PCR and determination of base sequences. The new sequences allow for reproductive and highly efficient analysis of gene
                                                                                                                                                                                                                                                         Peptides having at least two new nucleotides - useful as primers in RT-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   g
```

```
This sequence represents a primer of the invention. The invention relates to sequences of at least two nuclectides of formula: (X)m5'-(alpha)n-beta -N3'; or (X)m5'-(gamma) **Ledelta-N3'; where X = a labelled compound and/or a nucleotide with voluntary sequence; m = 0 or 1; alpha = thywine; n = natural number indicating the repetition of alpha; beta, delta = V or N; V = adenine, quanine or cytosine; N = adenine, guanine, cytosine or thymine; gamma = thymine; k = natural number of 3 or over indicating the repetition of gamma, in which thymine expressed by gamma is composed of 1/3 or less of adenine, quanine and/or cyrosine. The new nucleotides are useful as primers for RT-PCR and determination of base sequences. The new sequences allow for reproductive and highly efficient analysis of gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence represents a PCR primer used in the identification of a human pollenosis associated gene. The gene is highly expressed in individuals with high pollen-specific immunoglobulin E (IgE) levels. The
                                                                                  Peptides having at least two new nucleotides - useful as primers in RT-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gunji S;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes novel DNA sequences preferentially expressed in IgA nephropathy patients, and DNA sequences stringently hybridizing to them. Independent claims cover disgnostic reagents for IgA nephropathy incorporating the antisense sequences; the treatment of IgA nephropathy using the antisense sequences; the treatment of IgA nephropathy using the antisense sequences for mRNA inhibition; proteins associated with IgA nephropathy, containing sequences encoded by the DNA sequences; antibodies recognizing these productions the production of the proteins by culture of host cells transformed with DNA encoding them; diagnostic reagents for IgA nephropathy containing the antibodies; and compositions for the treatment of IgA nephropathy which contain the antibodies. The products of the invention can be used for the diagnosts and treatment of IgA nephropathy. This sequence represents a primer used in the isolation and identification of the human igA nephropathy-associated proteins
invention relates to the nucleotide sequence encoding the pollenosis associated protein, diagnosing pollenosis and screening candidate compounds for treating pollenosis. The gene can be used in diagnosing pollenosis, particularly cedar pollenosis, and screening candidate compounds for pollenosis treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Kuga T;

display, in the method of the invention. The specification describes a method for measuring the level of two or more nucleic acid molecules a method for measuring the level of two or more nucleic acid molecules in a target. The method comprises contacting a probe with an arbitrarily or statistically sampled target and detecting the amount of specific binding of the farget to the probe. The methods can be used to identify contacting the amount of specific binding differentially expressed nucleic acid molecules associated with disease states, such as cancer, autoimmune disease, infectious disease, aging, a developmental disorder, proliferative disorder or neurological disorder. Alternatively the methods can be used to assess the efficacy or toxicity of or a resistance to a treatment. Also the methods can be used to determine differential expression of nucleic acid molecules in response to a stimulus, e.g. a chemical, drug or growth factor (especially especially can also be used to determine co-regulated genes that can be potential

```
The present invention describes nucleic acids (A) that interact stably with a target sequence and contain at least one phosphoro(di)thioate link, having endonuclase activity. (A), and moor generally any catalytic nucleic acid (A') that modulates expression of the oestrogen receptor gene, are used to treat cancer (particularly of breast or endometrium).

Complete acid (A') that modulates expression of the oestrogen receptor in vivo or by transforming cells ex vivo and implanting treated cells, or for other conditions associated with levels of oestrogen receptor.

Correlate inhibition of gene expression with alterations in phenotype, particularly for identification of therapeutic targets, and as research reagents (for RNA, in the same way that restriction endonucleases are used with DNA). The combination of therapeutic targets, and as research ceststance to nucleases, binding affinity and/or activity. AAA23503 to AAA24747 represent oestrogen receptor hammerhead ribozyme sequences.

CAAA2474 represent oestrogen receptor hammerhead ribozyme sequences.

CAAA2474 represent oestrogen receptor hairpin ribozyme sequences.

CR AAA2474 represent oestrogen receptor hairpin ribozyme sequences.

CR CAAA26105 represent oestrogen receptor hairpin ribozyme sequences.

CR CAAA26105 represent oestrogen receptor hairpin ribozyme sequences.

CR CAAA26105 represent oestrogen receptor hairpin ribozyme and antisense oligonucleotides used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New nucleic acids that interact, and optionally cleave, target sequences,

New nucleic acids that interact, and optionally cleave, target sequences, used to treat cancer.

Claim 77; Page 79; 148pp; English.

The present invention describes nucleic acids (A) that interact stably with a target sequence and contain at least one phosphoro(di)thioate (Ink, having endonuclease activity. (A), and more generally any catalytic nucleic acid (A') that modulates expression of the oestrogen receptor gene, are used to treat cancer (particularly of breast or endometrium). (C) in vivo or by transforming cells as vivo and implanting treated cells, or for other conditions associated with levels of estrogen receptor. (C) for other conditions associated with levels of estrogen receptor. (C) Escause of the high selectivity for targeted RNA, (A) can also be used to correlate inhibition of gene expression with alterations in phenotype, particularly for identification of therapeutic targets, and as research creagents (for RNA, in the same way that restriction endonucleases are used with DNA). The combination of modifications in (A) improves consistence to nucleases, binding affinity and/or activity. AAA23503 to AAA23593 to AAA25010 represent cestrogen receptor hairpin ribozyme sequences. (C) AAA24747 represent cestrogen receptor hairpin ribozyme sequences. (C) AAA25010 to AAA2501 invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to the human pollinosis-associated gene 373 which exhibits significantly reduced expression in the T-cells of individuals with high cedar pollen-specific IgE (immunoglobulin E) levels. The gene was isolated from T-cells from individuals allergic to cedar pollen using the differential display method. The invention also relates also relates to the protein encoded by pollinosis associated gene 373; expression constructs and host cells comprising pollinosis-associated gene 373 nucleic acids; pollinosis-associated gene 373 nucleic acids; and a method of pollinosis-associated gene 373 nucleic acids; and a method of diagnosis of allergic diseases via the detection of pollinosis-associated gene 373 nucleic acids. The invention additionally encompasses methods of screening drug acids. The invention additionally encompasses methods of screening drug acids. The invention additionally encompasses methods of screening drug expression of pollinosis-associated gene 373 in pollen antigen-stimulated T-cells in the presence of a test compound relative to a control.

Pollinosis-associated gene 373 is useful in the diagnosis of allergic diseases and in the screening of drug candidates for the treatment of allergic diseases to the treatment of sequence represents a PCR primer used in the greening of drug candidates for the treatment of sequence represents a PCR primer used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                        Pollinosis-associated gene 373 undergoing significantly low expression in subjects with high cedar pollen-specific immunoglobulin-E levels, useful in diagnosis of allergic diseases and screening drug candidates.

The invention relates to the human pollinosis-associated gene 419 which exhibits reduced expression in the T-cells of individuals with high cedar pollen-specific IgE (immunoglobulin E) levels. The gene was isolated from T-cells from individuals allergic to cedar pollen using the differential display method. Pollinosis-associated gene 419 has homology with the gene encoding human Fas-associated factor-1 (FAF-1). The invention also constructs and host cells comprising pollinosis-associated gene 419; expression constructs and host cells comprising pollinosis-associated gene 419 primers and probes; antibodies against the protein encoded by the gene; methods of detection of pollinosis-associated gene 419 uncleic acids; and a method of diagnosis of allergic diseases via the detection of pollinosis-associated gene 419 uncleic acids. The invention additionally encompasses methods of screening drug candidates for the treatment of allergic diseases via the presence of a test compound relative to a control.Pollinosis-associated gene 419 in the presence of a test compound relative to a control.Pollinosis-associated gene 419 in the diagnosis of allergic diseases and in the screening of drug candidates (for the treatment of squed diagnosis of allergic diseases. The present sequence represents a PCR for the treatment of squed diagnosis of allergic diseases. The present sequence represents a PCR for the treatment of squed diagnosis of allergic diseases. The presents as a PCR for the treatment of squed diseases. The presents appresents a PCR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Pollinosis-associated gene 419 undergoing significantly low expression in subjects with high cedar pollen-specific IgE levels, useful in diagnosis of allergic diseases and screening drug candidates.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    for the treatment of such diseases. The present sequence represents a PCR primer used in the isolation of human pollinosis-associated gene 419 cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; pollinosis-associated gene 513; IgE; immunoglobulin E; cedar pollen allergy; T-cell; reduced expression; detection; diagnosis;

The invention relates to the human pollinosis-associated gene 513 which exhibits significantly reduced expression in the T-cells of individuals with high cedar pollen-specific IgE (immunoglobulin E) levels. The gene was isolated from T-cells from individuals allergic to cedar pollen using the differential display method. The invention also relates to methods of detection of pollinosis-associated gene 513 nucleic acids; a method of diagnosis of allergic diseases via the detection of pollinosis-associated gene 513 nucleic acids; and methods of screening drug candidates for the treatment of allergic disease by measuring the expression of pollinosis-associated gene 513 in pollen antigen-stimulated T-cells in the presence of a test compound relative to a control. Pollinosis-associated gene 513 in the diagnosis of allergic diseases and in the screening of drug candidates for the treatment of such diseases. The present sequence represents a PCR primer used in the isolation of human pollinosis-
                                                                                                                                                                                                                                                                                                           Pollinosis-associated gene 513 undergoing significantly low expression in subjects with high cedar pollen-specific IgE levels, useful in diagnosis of allergic diseases and screening drug candidates.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human, pollinosis-associated gene 581, IgE; immunoglobulin E, cedar pollen allergy; T-cell; reduced expression, detection; diagnosis; drug screening; allergic disease; PCR primer; ss.

The invention relates to the human pollinosis-associated gene 581 which exhibits significantly reduced expression in the T-cells of individuals with high cedar pollen-specific Ig8 (immunoglobulin B) levels. The gene cwas isolated from T-cells from individuals allergic to cedar pollen using the differential display method. The invention also relates also relates to the protein encoded by pollinosis-associated gene 581; to expression constructs and host cells comprising pollinosis-associated gene 581 mucleic acids; pollinosis-associated gene 581 primers and probes; antibodies against the protein encoded by the gene; methods of detection of pollinosis-associated gene 581 nucleic acids; and a method of diagnosis of allergic diseases via the detection of pollinosis-associated companied of gene 581 nucleic acids; and a method of companied to a pollinosis-associated gene 581 nucleic acids; and a method of companied to a control acids. The invention additionally encompasses methods of screening drug candidates for the treatment of allergic disease by control. Pollinosis-associated gene 581 is useful in the diagnosis of a control. Pollinosis-associated gene 581 is useful in the diagnosis of allergic diseases and in the screening of drug candidates for the treatment of such diseases. The invention relates to the human pollinosis-associated gene 795 which exhibits significantly reduced expression in the T-cells of individuals with high cedar pollen-specific IgE (immunoglobulin E) levels. The gene was isolated from T-cells from individuals allergic to cedar pollen using the differential display method. Pollinosis-associated gene 795 has concerned to the protein encoded by pollinosis gene 795; to expression relates to the protein encoded by pollinosis gene 795; to expression contains the protein encoded by pollinosis associated gene 795 constructs and host cells comprising pollinosis-associated gene 795 nucleic acids, pollinosis expression of pollinosis of allergic diseases via the detection of pollinosis-associated gene 795 nucleic acids. The invention additionally encompasses methods of screening drug candidates for the treatment of allergic disease by constructing the expression of pollinosis-associated gene 795 in pollen and an expression of pollinosis-associated gene 795 in pollen a control Pollinosis-associated gene 795 in pollen a control Pollinosis-associated gene 795 in pollen a control pollinosis-associated gene 795 in pollen treatment of such diseases. The present sequence represents a PCR primer used in the isolation of human pollinosis-associated gene 795 cDNA a control. Pollinosis-associated gene 795 is useful in the diagnos allergic diseases and in the screening of drug candidates for the treatment of such diseases. The present sequence represents a PCR

                                                               The present invention describes the human pollinosis-associated gene 465 which has a nucleic acid sequence of 3442 base pairs (bp), given in (AAC92291), that undergoes significantly low expression in subjects after pollen scattering, and is useful in the diagnosis of allergic diseases and screening candidate compounds for remedies capable of regulating the response of T cells to the stimulus by an antigen. The gene is useful in the diagnosis of allergic diseases and screening candidate compounds for remedies capable of regulating the response of T cells to the stimulus by an antigen. The present sequence represents a PCR primer which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Pollinosis-associated gene 787 undergoing significantly low expression in subjects after pollen scattering, useful in diagnosis of allergic diseases and screening candidate compounds to regulate response of T cells to antigen stimulus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to the human pollinosis-associated gene 787 which exhibits significantly reduced expression in the T-cells of individuals after the pollen-scattering season, relative to expression levels in T-cells before the pollen-scattering season. The gene was isolated from T-cells from individuals allergic to pollen using the differential display method. The invention also relates to pollinosis-associated gene 787 primers and probes; methods of detection of pollinosis-associated gene 787 nucleic acids; and method of diagnosis of allergic diseases via the detection of pollinosis-associated gene 787 nucleic acids. The invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            s,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 PCR anchor primer, SEQ ID NO:2, used in human gene 787 isolation.

ö
additionally encompasses a method of screening drug candidates for the treatment of allergic disease by measuring the expression of pollinosis-associated gene 787 in pollen antigen-stimulated T-cells in the presence of a test compound relative to a control. Pollinosis-associated gene 787 is useful in the diagnosis of allergic diseases and in the screening of argregation of the treatment of such diseases. The present sequence represents a PCR primer used in the isolation of human pollinosis-associated gene 787 cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention describes a novel nucleic acid molecule comprising a sequence (I) which undergoes significantly low expression in subjects after pollen scattering, and is useful in diagnosis of allergic diseases and screening candidate compounds for remedies capable of regulating the response of T cells to the stimulus by an antigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gunji S;

The present invention relates to a method for providing a profile of mRNA molecules present in a sample. The method comprises generating two independent patterns characteristic of the population of mRNA molecules expressed in the sample and analysing the patterns using a combinatorial algorithm, comparing gene expression by different or same cell types under different conditions, and identifying genes having a role in various cellular processes. The method is useful for the analysis and identification of transcribed genes, and fingerprinting. The method can be used to identify genes which play a role in determining various cellular processes, including susceptibility to external factors, development, and disease. The present sequence for a PCR primer is used in the production of a single pattern characteristic of a sample, employing a Type IIS restriction enzyme (i.e. FoXI) in the methods of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human, ss, PCR, acetyltransferase, 20-90-05; allergic disease, primer, differential display, eosinophil; antiallergic; atopic dermatitis; GT15A.
                                                                                                                                                                Providing mRNA profile, by generating two independent patterns characteristic of sample mRNA population, analyzing patterns, comparing gene expression by cell types under varied conditions, and identifying

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention provides a method of diagnosis of allergies that involves: assaying the levels of expression of genes B101, B1466, B1072 or B1151 in T-cells; and comparing them with the level of expression in healthy T-cells. The method is useful for diagnosing allergies, particularly atopic dermatitis. The present sequence represents a PCR primer used for analysis of the expression of the above genes

The specification describes a method for examining allergosis. The method comprises measuring the expression level of the gene given in ABL59037, and comparing it with the expression level of the gene in the eosinophils of a healthy person. The method is used for the examination of allergosis. The present sequence represents a PCR primer, which is used in the course of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a method for examining allergic diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                which involves determining the expression level of a gene, having one of the 17 nucleotide sequences shown in ABN99812-ABN99828, in the eosinophils in a patient and comparing the expression level with that in the eosinophils of a healthy individual. The method can be used to examine allergic diseases, particularly atopic dermatitis, and its early diagnosis, which is also applicable in screening candidate compounds for remedies. The present sequence is a PCR primer described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Method for examining allergic diseases by differential display of seventeen genes showing different expression particularly significant increase in eosinophils in patients with mild atopic dermatitis, also applicable in screening compounds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; allergy; atopic dermatitis; eosinophil; anti-allergic; PCR;

                                                                                                                                                                                                                                                                                                                                                                                        ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a method for examining allergic diseases comprises determining the expression level of a gene containing, the human cDNA appearing as ABK49633 which has homology with a cetyltransferases in the eosinophils of a patient and comparing the expression level with that in the eosinophils of a healthy individual compounds which affect the expression level of the gene or the candidate compounds which affect the expression level of the gene or the activity of the protein encoded by the gene (including related proteins and mutants), the use of probes based on the gene sequence in the carmination of allergic diseases, the use of reporter constructs in the correction of allergic diseases, the use of reporter constructs in the correction of an endiance of the gene, cells transformed with the vector, an antibody against the protein and a model animal for allergic diseases (which is a transgenic non-human vertebrate with lowering of expression intensity of the gene in eosinophils. The method is examining allergic diseases particularly atopic dermattits which is also applicable in screening candidate compounds for remedies. Such method can be performed in high throughput, at low cost. The present sequence is a differential
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a method of examining allergic diseases which comprises comparing the expression level of gene B1153 in allergy patients with the expression level in healthy subjects. The method is useful for the treatment, prevention, disagnosis and study of allergic diseases including atopic skin inflammation and asthma. The present sequence is a PCR primer described in the exemplification of the

The method is for examining allergic diseases, particularly atopic dermatitis, which is also applicable in screening candidate compounds for remedies. The present sequence is an anchor primer described in the exemplification of
                                                                                                                                                                                                                                   Method for examining allergic diseases by differential display of intersectin 2 gene showing different expression particularly significant increase in eosinophils in patients.

```
This invention relates to gene sequences that are differentially expressed in eosinophils from patients with atopic dermatitis in the increment stage as compared with those in the remission stage. These sequences are used in a novel method for examining allergic diseases comprising determining the expression levels of these genes and comparing individual. The method of the invention may have antiallergic or dermatological activities. The method can be used to diagnose allergic diseases particularly atopic dermatitis, and may also be used to screen candidate compounds for remedies. The method of the invention can be performed in high throughput, at low cost. The present sequence represents the GT15a PCR primer used to amplify the differentially
                                                                                     Examining allergic diseases by differential display of genes showing different expression particularly increase in remission stage in eosinophils in patients.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             amplified atopic dermatitis related cDNA sequences of the invention

New isolated nucleic acid encoding oxalate decarboxylase from Aspergillus phoenices, for degrading oxalic acid, identifying transformed plant cells, and preventing pathogenic disease in plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is that of a primer used in the invention. The invention relates to a novel nucleic acid (see ABZ70560) encoding Aspergillus phoenices oxalate decarboxylase (APOXD) (see ABP72475). The gene and its encoded protein are useful in degrading oxalate, in diagnostic assays, for protecting plants against disease, and as a selectable marker
                                                                                                                                                                                                                                                                                                                                                                                                                                                Aspergillus phoenices; oxalate decarboxylase; APOXD; transgenic plant; crop protection; primer; ss.

New naturally derived DNA specifically expressed during blastogenesis of a plant, useful for producing a transformed plant and for compulsive expression of a protein.
                                                                                  Producing a population of double-stranded product DNA molecules, useful for mRNA profiling, comprises amplification by nested polymerase chain reaction.
                                                                                                                                                                                                                         The invention relates to producing a population of double-stranded product DNA molecules comprising amplification by a nested PCR method. The method is useful in profiling mRNA transcribed in a system under investigation. The oligonucleotides are used as size standards in electrophoresis, and as internal controls allowing for calculation of relative amounts of material present. The present sequence represents double stranded product DNA, which aids in outlining an approach to production of a single pattern characteristic of a sample, employing a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    during plant blastogenesis. The DNA of the invention is useful for producing a transformed plant. Methods of the invention are also useful for compulsive expression of this DNA. Methods of the invention are useful for plant tissue specific expression of genes. Also, the growth stage of a plant can be controlled specifically. The current sequence represents a PCR primer for amplifying a plant blastogenesis specific gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               PCR primer for amplifying plant blastogenesis specific gene #SEQ ID 1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Plant blastogenesis; transformation; gene expression; tissue specific;

                                                                                                                                                                                                                                                                                          Determining polyadenylation sites within transcribed gene sequences present in a sample comprises assigning to gene fragments gene candidates within a database by comparing signals in the dataset with the database.
                                                                                                                                                                                                                                                                                                                                                                                                                                                       polyadenylation site within a sequence of a transcribed gene or variants present in a sample. The method involves assigning to gene fragments gene database, the database by comparing signals in the dataset with the database, the database comprising data representing mRNAs with known polyA sites and/or 'virtual genes' representing a possible polyadenylation site within an actual gene. The method is useful for determining the presence of and/or identifying a polyadenylation site or alternative polyadenylation sites within a sequence of a transcribed gene or sequences of transcribed gene fremences of transcribed gene fremences of transcribed gene features, particularly in identifying differences between sequence variants that occur in a population of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             usage or determining polyA site usage in a nucleic acid sample, and variants artising from alternative polyA sites. The present sequence

The invention relates to a novel isolated nucleic acid that encodes a protein with a chromatin organisation modifier (CHROMO) domain. The polynucleotide of the invention demonstrates cytostatic activity and may be useful for preparing a composition for treating or preventing a composition for treating or preventing a pcoper associated with decreased or increased expression or activity of prost (prostate cancer candidate protein 1), such as a tumour, as well as during gene therapy and vaccine production procedures. The current sequence is that of the human PCCP1-related DNA fragment SEO ID 4-sequence probe of the invention. Note: The current sequence is not shown within the specification per se but was retrieved from the WipoWeb
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New prostate cancer candidate protein 1 (PCCP1), useful for preparing a composition for treating or preventing a disorder associated with decreased or increased expression or activity of PCCP1 e.g., tumor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               chromatin organisation modifier; CHROMO domain; cytostatic; PCCP1; prostate cancer candidate protein 1; tumour; gene therapy; vaccine;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to novel gene prediction methods. The novel methods
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               comprise searching a gene datebase and utilising the information about the size of a known nucleotide sequence to a specific sequence in a target fragment and using the information about the specific sequence in a extract a predicted gene. The methods are used for identifying novel useful genes. The novel gene prediction methods make it possible to predict a gene contained in a DNA fragment obtained as a result of gene expression analysis effectively in a simple and easy manner. The methods and efficiency of genetic analysis is markedly improved. This

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ó
                                                                                                                                                                                                                                The invention relates to a novel isolated nucleic acid that encodes a protein with a chromatin organisation modifier (CHROMO) domain. The polynucleotide of the invention demonstrates cytostatic activity and may be useful for preparing a composition for treating or preventing a disorder associated with decreased or increased expression or activity of PCCP1 (prostate cancer candidate protein 1), such as a tumour, as well as during gene therapy and vaccine production procedures. The current sequence is that of the human PCCP1-related DNA fragment SEQ ID 4-directed probe of the invention. Note: The current sequence is not shown within the specification per se but was retrieved from the WipoWeb

The invention comprises nucleic acids (e.g. antisense oligonucleotides)
that down regulate the expression or inhibit the function of a receptor
for a neurite growth inhibitor, NOGO, prostaglandin DZ receptor (PTGRR),
IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the
invention are useful for treating: cerebrovascular accident, central
nervous system (ONS) injury, spinal cord injury, cancer (e.g. melanoma,
lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis,
restenosis or asthma), inflammatory disease, obesity, autoimmune
disease, lupus, multiple sclerosis, transplant/graft rejection,
ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic
conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
nucleic acids of the invention are also useful for down-regulating the
expression of a target gene and as a diagnostic tool to examine genetic
drifts and mutations within diseased cells or to detect the presence of a
target RNA in a cell. The present RNA sequence represents a human IKK-
                                                                                                                                                                                                                       Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or protein kinase PKR genes, for treating cancer and inflammatory disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       antisense oligonucleotide; neurite growth inhibitor; NOGO; prostaglandin D2 receptor; PTGDR; IkappaB kinase; IKK; prostaglandin D2 receptor; PTGDR; IkappaB kinase; IKK; protein kinase PKR; cerebrovascular accident; central nervous system injury; CNS injury; spinal cord injury; cancer; melanoma; lymphoma; glioma; inflammatory disease; rheumatoid arthritis; restenosis; asthma; Crohn's disease; diabetes; obesity; autorimmune disease; lupus; multiple sclerosis; transplant rejection; graft rejection; ischaemia; reperfusion; glomerulonephritis; sepsis; allergy; asthma; allergic rhinitis; atopic dermatitis; Human IKK-gamma;

                                                                                                                                                                                                                                                                                                                                                                           à
                                                                                                                                                                                                                                                                                                                   g
                                                                                                                                              The invention comprises nucleic acids (e.g. antisense oligonucleotides)
that down regulate the expression or inhibit the function of a receptor
for a newrite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR),
[StappaB kinase [KKK], or protein kinase PKR. The nucleic acids of the
invention are useful for treating: cerebrovascular accident, central
nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,
lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis,
restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune
disease, lupus, multiple sclerosis, transplant/graft rejection,
conditions (e.g. asthma, allergic rhinitis or atopic dermatiis). The
nucleic acids of the invention are also useful for down-regulating the
expression of a target gene and as a diagnostic tool to examine generic
diffts and mutations within diseased cells or to detect the presence of a
target RNA in a cell. The present RNA sequence represents a human IKK-
gamma substrate sequence.
                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                    Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or protein kinase PKR genes, for treating cancer and inflammatory disease.
                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 human; PCR; ss; allergic disease; NOR-1; MINOR; eosinophil;

This invention relates to a novel method for examining allergic diseases that comprises comparing the expression levels of a gene encoding the NOR-1 receptor protein between patients and healthy individuals.

Specifically, the NOR-1 gene, also referred to as MINOR, is expressed in the specialist white blood cells known as eosinophils and is involved in mediating an allergic reaction. The present invention describes a differential display method that can identify the expression level of this gene in order to identify its usefulness in diagnosing allergic diseases such as atopic dermatitis. Furthermore, compositions can also be used to screen compounds for the treatment of allergic diseases. Accordingly, they exhibit various activities including antiallergic.

PER primer used to amplify human NOR-1 DNA in an exemplification of the The invention relates to an oligonucleotide having the formula: (a) 5' XYNIYZN2 3' where 5' denotes the 5' end of the oligonucleotide and 3' denotes the 3' end of the oligonucleotide, where X is a T or modified T nucleotide, X is a G or modified C nucleotide, Z is a G or modified C New oligonucleotides, useful for treating an allergy or asthma, or an autoimmune disease, arthritis, systemic lupus erythematosus, multiple sclerosis, Crohn's disease, or Type 1 diabetes mellitus. Examining allergic diseases e.g. atopic dermatitis by differential display based on gene expression of NOR-1 receptor protein, also applicable in screening compounds for treatment of allergic diseases Gaps pharmaceutical; therapeutic; immune stimulation; immune response; allergy; asthma; autoimmune disease; antiasthmatic; antiallergic; immunosuppressive; phosphorothloate; ss. . 0 IL-10 expression assay, test oligonucleotide SEQ ID No:33. connucleotide, and NI and NZ are polymucleotides that do not include a CG dinucleotide, where NI does not include 5' Z nucleotide, and where a 3' polymucleotide consisting of the YZ dinucleotide and the NZ polymucleotide contains a number of nucleotide that is at most 45% of the number of nucleotides in the oligonucleotide, and (b) 5' XYNIYZNZ 3' where 5' denotes the 5' end of the oligonucleotide, where XI as a Tor modified and 3' denotes the 3' end of the oligonucleotide, where XI as a Tor modified T nucleotide, Y is a C or modified C nucleotide, where NI does not include a CG a polymucleotide of 5-10 nucleotides, where NI does not include a CG a polymucleotide of 5 to 30 nucleotides. Also described are: (1) a pharmaceutical composition comprising the oligonucleotide in combination which a therapeutic agent selected from chemotherapeutic agents, monoclonal antibodies, and anticancer agents; (2) a method of specifically increasing interleukin (IL)-10 expression and antiche comprising contraction of the services and anticancer agents. distriction to interior the control time a subject, comprising an oligonaclectide or a pharmaceutical composition to the subject in need of increased IL-10 expression relative to IFN-alpha expression, (3) a method of inducing an antigen-specific regulatory T call response in a subject by administering an immunostimulatory nucleic exposed to an antigen, (4) a method of inducing an antigen-specific regulatory B cell response in a subject by administering an antigen-specific regulatory B cell response in a subject by administering an antigen, (5) a method of treating an allergy or subject exposed to an antigen, (5) a method of treating an allergy or subject exposed to an antigen, (5) a method of treating an allergy or immunostimulatory nucleic acid or composition to the subject, where the immunostimulatory nucleic acid or composition is administered in an anount sufficient to prevent or alleviate an allergic response to the allergen in the subject; (6) a method of treating an autoimmune disease to an immunostimulatory nucleic acid or composition to the subject, where the immunostimulatory nucleic acid or composition is administered in an immunostimulatory nucleic acid or composition is administered in an acount sufficient to prevent or treat an autoimmune disease in the subject; and (7) a method of reducing an antigen-specific response to an implant in a subject by exposing a subject to an implant antigen, and anti subject, where the immunostimulatory nucleic acid or composition is administered in an amount sufficient to prevent or reduce an antigenspecific response to the implant in the subject. The oligonucleotide includes at least 1 modified internucleotide linkage such as a phosphorothioate linkage. The oligonucleotide, methods and compositions of the invention are useful for treating allergies, asthma, autoimmune diseases, arthritis, systemic lupus erythemacosus, multiple sclerosis, crohn's disease, Type 1 diabetes mellitus, myasthenia gravis, autoimmune neuropathies such as Guillain-Barre, autoimmune uveltis, autoimmune hemolytic anemia, pernicious anemia, autoimmune thrombocytopenia, Crohn's polymyositis, dermatcomyositis, spondyloarthropathies such as ankylosing spondylitis, and Sjogren's syndrome. The autoimmune disease is caused by an infection e.g. Lyme disease. This sequence represents an oligonucleotide used in experiments in the examples of the present temporal arteritis, anti-phospholipid syndrome, psoriasis, pemphigus vulgaris, vasculitis such as Wegener's granulomatosis, vitiligo, Crohn's Disease, ulcerative colitis, primary biliary cirrhosis, autoimmune hepatitis, immune-mediated diabetes mellitus, Grave's Disease, Hashimoto's thyroiditis, autoimmune oophoritis and orchitis, autoimmune disease of the adrenal gland, rheumatoid arthritis, scleroderma, invention.

New oligonucleotides, useful for treating an allergy or asthma, or an autoimmune disease, arthritis, systemic lupus erythematosus, multiple sclerosis, Crohn's disease, or Type I diabetes mellitus.

Example, SEQ ID NO 30; 111pp; English.

The invention relates to an oligonucleotide having the formula: (a) 5, XYNIXZN2 3, where 5, denotes the 5, end of the oligonucleotide and 3, denotes the 3, end of the oligonucleotide, where X is a T or modified T uncleotide, Y is a C or modified C nucleotide, and or modified G uncleotide, and where a 3, or uncleotide, where N is a C or modified C nucleotide and the N2 mucleotide, and where a 3, polynucleotide, where N is number of nucleotide and the N2 comparing of the YZ dinucleotide, and where a 3, polynucleotide consisting of the YZ dinucleotide and the N2 polynucleotide consisting of the PZ dinucleotide and the N2 polynucleotide consisting of the Oligonucleotide and 3, denotes the 3, end of the oligonucleotide and 3, denotes the 3, end of the oligonucleotide and 3, denotes the 3, end of the oligonucleotide and 3, denotes the 3, end of the oligonucleotide and 3, denotes the 3, end of the oligonucleotide and 3, denotes the 3, end of the oligonucleotide and 3, denotes the 3, end of 5 to 3 nucleotides, where N1 does not include 5, Z nucleotide, N1 is a polynucleotide of 5 to 3 nucleotides. Also described are: (1) a polynucleotide of 5 to 3 nucleotides. Also described are: (1) a paramaceutical composition comprising the oligonucleotide in combination with a therapeutic agents, monoclonal antibodies, and anticancer agents; (2) a method of specifically increasing interleuxin (11)-10 expression relative to interferen (17)-10 expression relative to interferen (17)-10 expression relative to interferen (17)-10 expression relative to onterferen (17)-10 expression relative to or interferent (17)-10 expression relative to interferent (17)-10 expression relativ amount sufficient to prevent or alleviate an allergic response to the allergen in the subject; (6) a method of treating an autoimmune disease in a subject by exposing a subject to a self antigen, and administering an immunostimulatory nucleic acid or composition to the subject, where the immunostimulatory nucleic acid or composition is administered in an amount sufficient to prevent or treat an autoimmune disease in the subject; and (7) a method of reducing an antigen-specific response to an implant in a subject by exposing a subject to an implant antigen, and administering an immunostimulatory nucleic acid or composition to the

```
administered in an amount sufficient to prevent or reduce an antigen-
specific response to the implant in the subject. The oligonucleotide
includes at least I modified internucleotide linkage such as a
phosphorothicate linkage. The oligonucleotide, methods and compositions
of the invention are useful for treating allergies, asthma, autoimmune
diseases, arthritis, systemmic lupus erythemacosus, multiple sclerosis,
crohn's disease, Type I diabetes mellitus, myasthenia gravis, autoimmune
hemolytic anemia, pernicious anemia, autoimmune thromborytopenia,
cemporal arteritis, anti-phospholipid syndrome, psoriasis, pemphigus
vulgaris, vasculitis such as Wegener's granulomatosis, vitiligo, Crohn's
Disease, ulcerative colitis, primary biliary cirrhosis, autoimmune
hepatitis, immune-mediated diabetes mellitus, Grave's Disease,
Hashimoto's thyroiditis, autoimmune opphoritis and orchitis, autoimmune
clisease of the adrenal gland, rheumatoid arthritis, scleroderma,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

      The inventors claim DNA fragments capable of expressing, in a host, a prod. contg. at least one antigenic determinant of papillomavirus (PV), (See AAN30170-01731). Also claimed are immunogens consisting of at least one peptide sequence coded for by the DNA fragments (see AAP30310-P30313), vaccines contg. the immunogens and antibodies raised from them. antibodies are useful in human and veterinary medicine and the antibodies are useful as diagnostic reagents. The DNA fragments are most esp. derived from the L1 region of human PV type la
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This is the nucleotide sequence of a PCR primer used in the method of the invention, involving the use of novel apoptosis-related DNAs and proteins. The inventions can be used as diagnostic reagents for apoptosis e.g. (monoclonal) antibodies for the protein, as a reagent in immunohistological staining, as a spoptosis inhibitors. It can also be used for treatment of apoptosis-related diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 9
                                                                                                                                                Revised record issued on 09-SEP-2004 : Correction of feature table key
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel apoptosis-related DNAs and proteins - for diagnosis, preventing treating diseases associated with apoptosis.

This is the nucleotide sequence of a PCR primer used in the method of the invention, involving the use of novel apoptosis-related DNAs and proteins. The inventions can be used as diagnostic reagents for apoptosis e.g. (monoclonal) antibodies for the protein, as a reagent in immunohistological staining, as apoptosis inhibitors. It can also be used for treatment of apoptosis-related diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                tissue relating to obesity, particularly complications of visceral obesity including diabetes, hyperlipemia, hypertension, arteriosclerosis, hyperuricemia and sleep apnea syndrome. The genes (AA296631-633) and the proteins (AAV67598-V67600) are used in the genetic diagnosis, prevention and treatment of adipose tissue related diseases. Sequences AA29640-51 represent PCR primers amplifying the human adipose tissue genes
                                                                                                                                                                                Novel apoptosis-related DNAs and proteins - for diagnosis, preventing or treating diseases associated with apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A physiologically active protein specifically derived from mammal tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to identification of genes and proteins of adipose

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This is the nucleotide sequence of a PCR primer used in the method of the invention, involving the use of novel apoptosis-related DNAs and proteins. The inventions can be used as diagnostic reagents for apoptosis e.g. (monoclonal) antibodies for the protein, as a reagent in immunohistological staining, as apoptosis inhibitors. It can also be used for treatment of apoptosis-related diseases

                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to identification of genes and proteins of adipose tissue relating to obesity, particularly complications of visceral obesity including diabetes, hyperlipemia, hypertension, arteriosclerosis, hyperuricemia and sleep apnea syndrome. The genes (AAZ90631-633) and the proteins (AAY67589-Y67600) are used in the genetic diagnosis, prevention and treatment of adipose tissue related diseases. Sequences AAZ90640-51 represent PCR primers amplifying the human adipose tissue genes
                                                                                                                                                                                                                                                                                                                                                                   A physiologically active protein specifically derived from mammal tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Adipose tissue; obesity; diabetes; hyperlipemia; hypertension; human; arteriosclerosis; hyperuricemia; sleep apnea syndrome; PCR primer; ss.

```
A physiologically active protein specifically derived from mammal tissue.
                                                                                                                                                                                                                                                                                                                                                            The invention relates to identification of genes and proteins of adipose tissue relating to obesity, particularly complications of visceral obesity including diabetes, hyperlipemia, hypertension, arteriosclerosis, hyperucicemia and sleep apnea syndrome. The genes (AAZ9631-633) and the proteins (AAY67598-Y6760) are used in the genetic diagnosis, prevention and treatment of adipose tissue related diseases. Sequences AAZ90640-51 represent PCR primers amplifying the human adipose tissue genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Producing binary sequence tags, useful for analyzing nucleic acid sequence tags, gene expression or gene-expression patterns, involves generating nucleic acid fragments, which are mixed with offset adaptors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (UYYA ) UNIV YALE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       WO200112855-A2.
```

Gaps

```
Lags from nucleic acid fragments in a sample, involving binary sequence tags from nucleic acid fragments in a sample, involving incubating the sample with cleaving reagents, mixing offset adaptors with the sample, incubating with more cleaving reagents and mixing the sample with adaptor -indexers where the adaptors are coupled to binary sequence tags. The method is useful in sequence analysis, including analysis and comparison of gene expression, nucleic acid samples and genomes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           for treating and/or preventing cytomegalovirus (CMV) infection and/or related diseases. The method of the invention comprises contacting a test compound with at least one of the cellular kinases RICK, RIP, Nck-Interacting kinase, MKK3 and SPRY-2 and detecting any change in kinase activity. The method of the invention can be used to treat and/or prevent CMV infections and related diseases. Oligonucleotides that can detect the specified kinases can also be used for diagnosis of infection. The present nucleic acid sequence represents human CMV reverse transcriptase (RT)-PCR primer TXN that was used in the methods of the invention for preparation of radioactively labelled cDNA probes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        present invention relates to a new method for identifying compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  compound with cellular kinase and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human cytomegalovirus; HCMV; virucide; cytomegalovirus infection;

The invention relates to novel pyridylpyrimidine derivatives and methods of detecting prion infections and/or prion disease in an individual or in cells, cell cultures and/or cell lysates. The method involves adding at least one monoclonal or polyclonal antibody, oligonucleotide or pyridyleast one monoclonal or polyclonal antibody, oligonucleotide or pyridylex pyrimidine derivative to the sample or in cells, cell cultures and/or cell lysates and detecting the activity of at least one human cellular protein kinases (e.g., FGF-R1 (also known as flg, F1-1, F1t-2, b-FGFR). Tkt (also known as CCK-2, DDR-2 or EDDR; EC number 2.7.1.112), Abl (also known as CCK), PRK, human cellular protein phosphatases such as PTP-SL known as CCK1), PRK, human cellular protein phosphatases such as PTP-SL (also known as MCP83) and PTP-zeta, the cellular signal transduction of prions in cells and in the manufacture of pharmaceutical production of prions in cells and in the manufacture of pharmaceutical composition for prophylaxis and/or treatment of infectious disease (e.g. composition for prophylaxis and/or treatment of infectious disease (e.g. CCR production of prions in cells and in the manufacture of pharmaceutical composition wasting disease (CMD), transmissible mink encephalopathy (TMB), creutzfeldt-Jacob disease (CMD), bovine spongiform encephalopathy (EME), variant CUD, Gerstmann-Straussler-Scheinker syndrome (GSS), fatal familial insomnia (FFI), Kuru and Alpers syndrome, especially BSE, CUD,

The invention relates to an anti-proliferative substance for preventing uncontrolled cellular proliferation comprising a radiolabelled DNA carrier, where a radiolabelled DNA carrier, where a radiolabelled DNA carrier aguence, at 5' end or at 3' end, and the radiolabelled DNA carrier penetrates the cell membrane and is retained intracellularly for a time in the anti-proliferative substance is an oligonucleotide, which is linear or a plasmid, which is circular. The plasmid is of viral or bacterial origonucleotide is a double- or a single-stranded DNA sequence, which is conjugated with an antibody for cell-specific delivery. The oligonucleotide is also conjugated to a stent surface, choice acid, losic acid,

The invention relates to an antisense oligonucleotide or its active derivative selected from AEC46395, targeting human interleuking derivative selected from AEC46374-AEC46395, targeting human interleuking control of [1L-10]. Also included are a process of manufacturing the antisense coligonucleotide (or its active derivative, by adding consecutive nucleosides and linker stepwise or by cutting the oligonucleotide out of nucleosides and linker stepwise or by cutting the oligonucleotide out of composition for treating cancer. The oligonucleotide is an antisense oligonucleotide inhibiting the synthesis of proteins involved in the composition of metastases. The oligonucleotide is an antisense oligonucleotide inhibiting the production of transforming growth factor (TGF)-beta 1, TGF-beta 3, TGF-beta 3, call-cell adhesion molecules (CMMS), integrins, selectins, metalloproteases (MMPs), their tissue confinibitors (TTMPs) and/or interleukins 10. The oligonucleotides are useful for the preparation of a pharmaceutical composition for inhibiting the formation of metastases in cancer treatment. The oligonucleotides are useful for treating cancer, bronchogenic carcinoma, carcinoma, cervical carcinoma, colon carcinoma, colon carcinoma, coloneactal carcinoma, embryonal carcinoma,

Also included are a process of manufacturing the antisense oligonucleotide (or its active derivative, by adding consecutive nucleosides and linker stepwise or by cutting the oligonucleotide out of longer oligonucleotide chain), a pharmaceutical composition comprising the antisense oligonucleotide and a TGF-beta 2 antagonist for preparing a composition for treating cancer. The oligonucleotide is an antisense oligonucleotide inhibiting the synthesis of proteins involved in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New antisense oligonucleotides inhibiting the synthesis of proteins involved in the formation of metastases such as transforming growth factor-beta 1 (TGF-beta 1), TGF-beta 2 and TGF-beta 3, useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Stauder G;
